

Abstract

A drop-away arrow rest having an arrow support arm that drops in a straight, non-pivotal and non-rotational path. The arrow rest that has an arrow support arm that lifts the arrow, from a first, relaxed, position to a second, actuated, position when the archer
5 draws the bowstring. Upon release of the bowstring, the arrow support arm drops, with vertical, non-rotational and non-pivotal movement, in a straight line, to return to its relaxed state. Actuation and release of the arrow support arm is accomplished by an attachment to the bowstring, such as a cord, and by a biasing means. The arrow rest includes various adjustment means that allow lateral and/or horizontal positioning of the
10 arrow in relation to the bow handle.
